

Strengthen Your Network Security with AnexGATE's Customized Solutions

Solution 1: Secure Branch to HO Connectivity and Data Encryption.

What it is: This solution establishes a secure SSL VPN tunnel between branch offices and the central head office (HO), allowing seamless and secure communication. It connects branch devices like cameras (DVRs) and PCs to the central AnexGATE USG at the HO while providing centralized management and secure access to critical resources.

How it works:

- 1. Branch Devices Setup:** Cameras (DVRs) and PCs at branches are connected to a local router and then to the AnexGATE SSL VPN tunnel for secure communication with the HO.
- 2. SSL VPN Tunnels:** Encrypt all data traffic between branches and the HO, safeguarding sensitive information from interception.
- 3. AnexGATE USG at HO:**
 - Provides robust centralized management of branch traffic and acts as a firewall for securing the network.
 - Offers LAN segmentation to separate different departments or systems for better data isolation and security.
 - Ensures user authentication via ID and password for accessing critical resources.

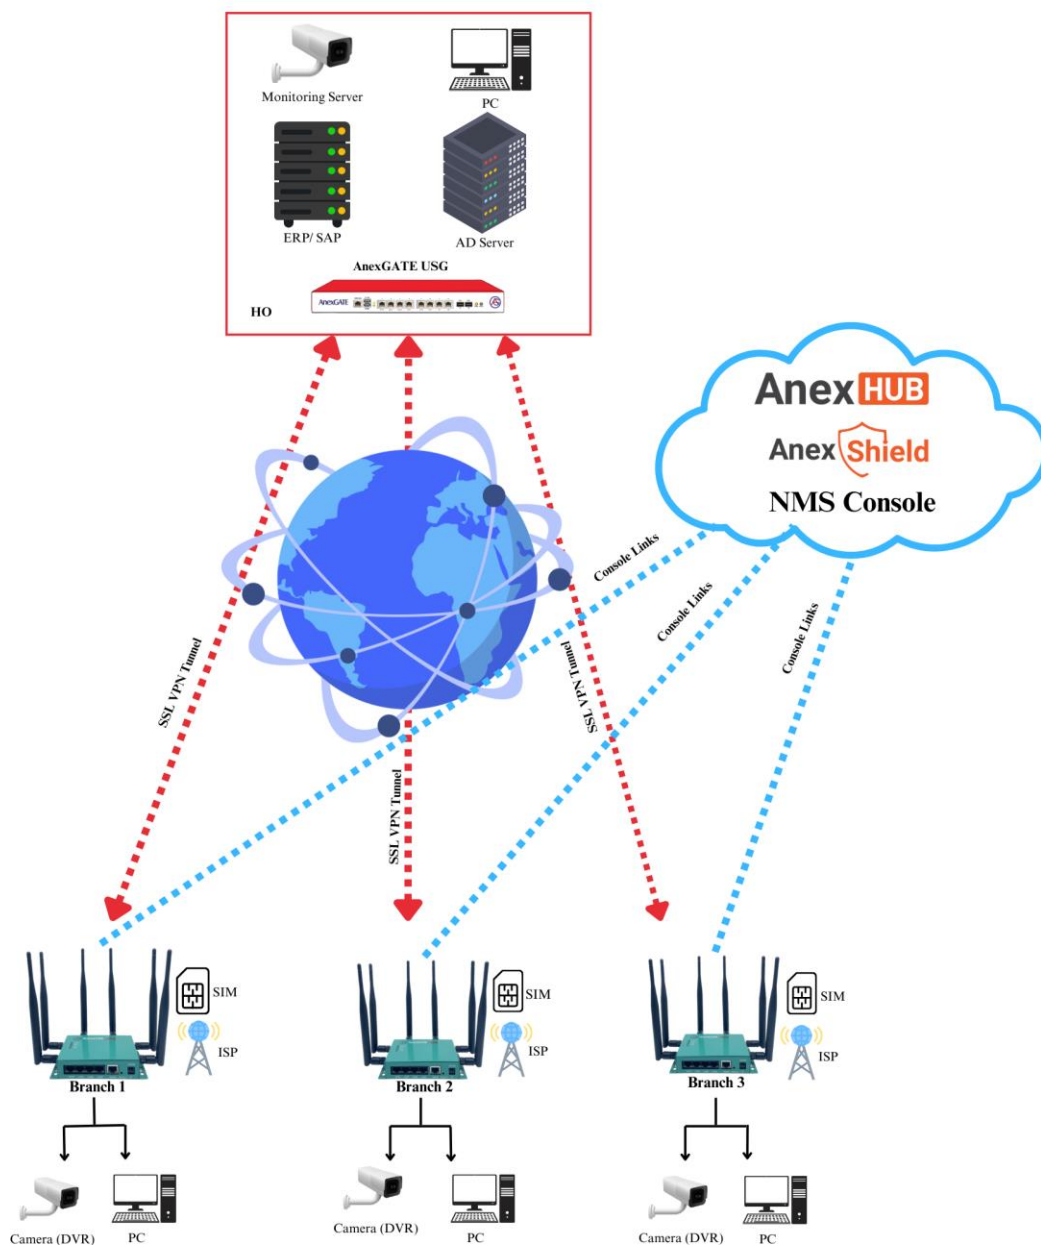

- 4. Camera Monitoring:** Live video feeds from branch cameras are securely transmitted to monitoring servers at HO, enabling centralized monitoring and control.
- 5. Access to HO Resources:** Resources like Monitoring Servers, AD Servers, and ERP/SAP systems are accessible.

Key Benefits at HO:

- Enhanced network security and centralized control.
- Separate LAN segments for improved data isolation and secure multi-department access.
- User authentication for controlled access to systems and data.
- Centralized camera monitoring for better surveillance and operational efficiency.

Solution 2: Centralized Network Monitoring and Security with AnexHUB and AnexSHIELD

What it is: This solution integrates multiple branch offices with the AnexHUB and AnexSHIELD. It provides centralized network monitoring and security management for IT administrators. Branch Wi-Fi and internet usage are controlled, monitored, and optimized for productivity.

How it works:

1. Wi-Fi and Internet Control at Branches:

- Branch Wi-Fi networks are controlled using user-based access policies to ensure secure and authorized usage.
- Internet access is monitored and restricted as per organizational policies, preventing unauthorized usage and ensuring bandwidth is utilized effectively.

2. Centralized Monitoring with AnexHUB:

- AnexHUB acts as a centralized console, collecting data from all branch devices and providing a unified management interface.
- IT administrators can monitor device health, bandwidth usage, and traffic in real-time from HO.
- Enables zero-touch deployment and centralized configuration of branch devices.

3. AnexSHIELD Security Monitoring:

- Provides advanced threat detection and real-time mitigation across the enterprise network.
- Monitors incoming and outgoing traffic for potential security risks.

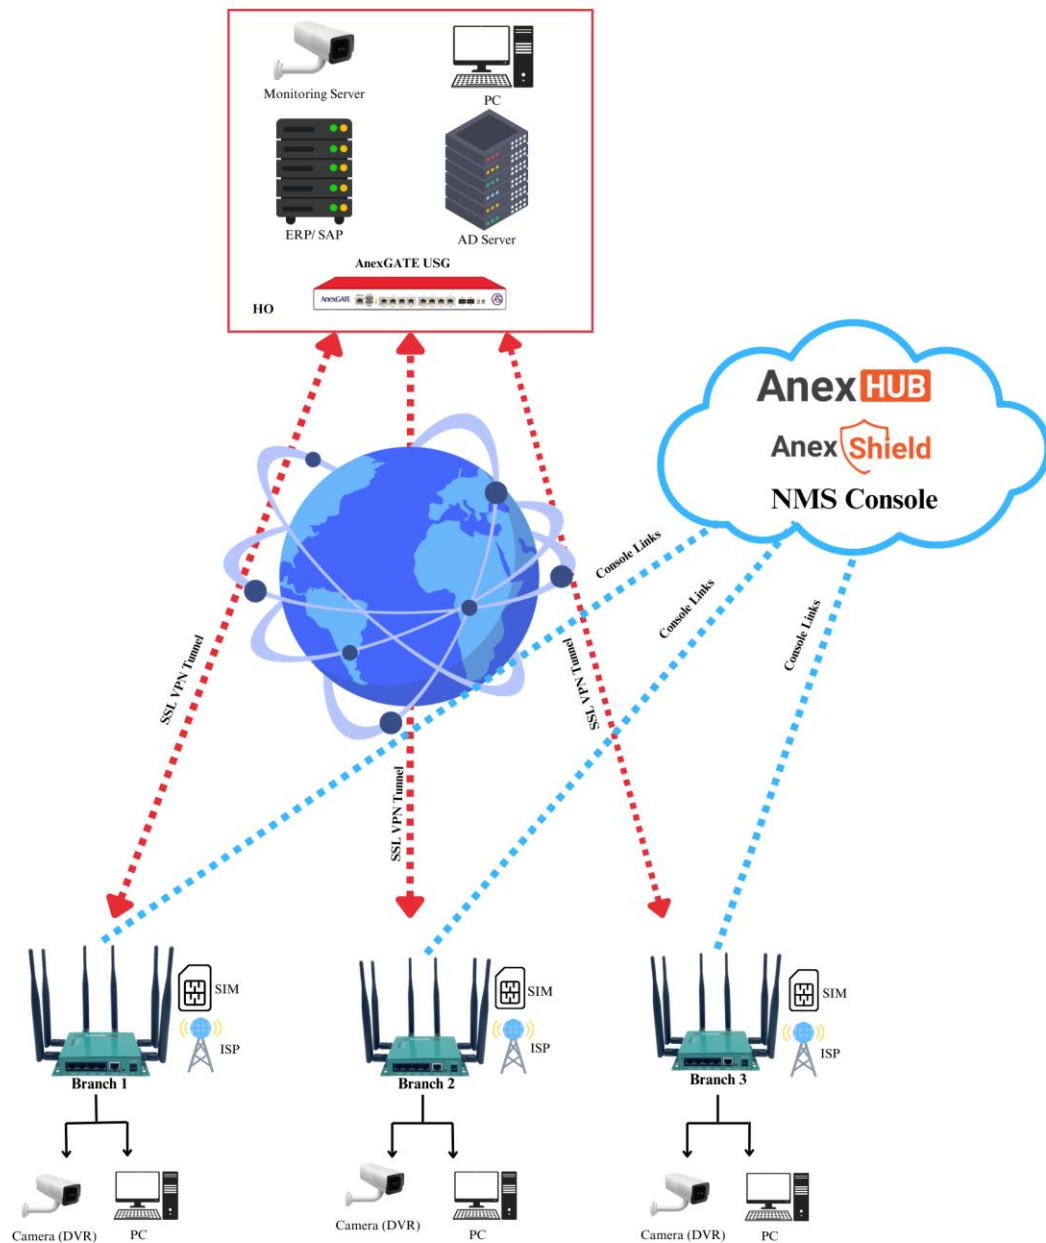

4. Secure Tunnels: SSL VPN tunnels encrypt communication between branches and HO, ensuring sensitive data remains secure.

Key Benefits at Branches:

- Controlled Wi-Fi and internet access for optimized bandwidth usage and employee productivity.
- Enhanced security monitoring with real-time threat detection.
- Streamlined configuration and centralized updates via AnexHUB.

Solution 3: Advanced Connectivity, User Authentication, and Compliance with AnexGATE ACE

What it is: This solution integrates **AnexGATE ACE** to extend secure connectivity to remote locations. It highlights advanced features like **user authentication**, **bandwidth aggregation**, **LAN segmentation**, and **compliance-friendly logging** for security and forensic analysis.

How it works:

- 1. User Authentication at HO:** Users log in with individual IDs and passwords to access specific LAN segments and resources. This ensures role-based access and enhances security compliance.
- 2. LAN Segmentation:** The HO network is divided into multiple LAN segments to segregate departments and ensure isolated traffic flow for security and better bandwidth allocation.
- 3. Secure Connectivity with ACE:**
 - At branches, ACE integrates with AnexHUB and AnexSHIELD to provide seamless connectivity, real-time monitoring, and enhanced security features.
 - Supports **bandwidth aggregation** and **Multi-Link Auto Failover** for reliable connectivity, even in remote areas.
- 4. Camera Monitoring Integration:** Cameras (DVRs) from branches are connected to ACE for real-time transmission of feeds to HO monitoring systems.
- 5. Compliance and Logging:** ACE generates detailed logs of user activity and network events, which are stored centrally for compliance and forensic analysis.

Key Benefits at HO:

- Role-based access control with user authentication.
- Separate LAN segments ensure secure data flow between departments.
- Enhanced connectivity and uptime with ACE's bandwidth aggregation and failover features.
- Detailed logging for compliance, troubleshooting, and security audits.

Key Benefits at Branches:

- Secure and consistent connectivity to HO.
- Real-time monitoring of branch activities, including cameras and network usage.
- Resilient network uptime with ACE's failover and aggregation features.
